

Flash**3.3V 1 Gbit****SPI-NAND Flash Memory****PRODUCT LIST**

Parameters	Values
V _{cc}	3.3V
Width	x1, x2 ¹ , x4
Frequency	104MHz
Internal ECC Correction	1 bit
Power-up Ready Time	1ms (maximum value)
Max Reset Busy Time	1ms (maximum value)

Note: 1. x2 PROGRAM operation is not defined.**FEATURES**

- Voltage Supply: 3.3V (2.7V~3.6V)
- Organization
 - Memory Cell Array: (128M + 4M) x 8bit
 - Data Register: (2K + 64) x 8bit
- Automatic Program and Erase
 - Page Program: (2K + 64) Byte
 - Block Erase: (128K + 4K) Byte
- Page Read Operation
 - Page Size: (2K + 64) Byte
 - Read from Cell to Register with Internal ECC: 100us
- Memory Cell: 1bit/Memory Cell
- Support SPI-Mode 0 and SPI-Mode 3¹
- Fast Write Cycle Time
 - Program time: 400us
 - Block Erase time: 4ms
- Hardware Data Protection
 - Program/Erase Lockout During Power Transitions
- Reliable CMOS Floating Gate Technology
 - Internal ECC Requirement: 1bit/512Byte
 - Endurance: 60K Program/Erase cycles
 - Data Retention: 10 years²
- Command Register Operation
- NOP: 4 cycles
- OTP Operation
- Bad-Block-Protect
- Read parameter page operation
- One Time Program (OTP) Operation
- Read Unique ID
- CASN page supported

Note:

1. Mode 0: CPOL = 0, CPHA = 0; Mode 3: CPOL = 1, CPHA = 1
2. Please refer to the reliability report.

GENERAL DESCRIPTION

Serial peripheral interface (SPI) NAND is an SLC NAND Flash memory device that provides a cost-effective nonvolatile memory storage solution where pin count must be kept to a minimum. It is also an alternative solution to SPI NOR, offering superior writes performance and cost per bit over SPI NOR. The hardware interface creates a low pincount device with a standard pinout that remains the same from one density to another and supports future upgrades to higher densities without board redesign.

The serial electrical interface follows the industry-standard serial peripheral interface.

New command protocols and registers are defined for SPI operation. The command set resembles common SPI-NOR command sets, modified to handle NAND specific functions and additional new features.

New features include user-selectable internal ECC and first page auto-load on power-up. SPI NAND Flash devices have six signal lines plus V_{CC} and ground (GND). The signal lines are SCK (serial clock), SI, SO (for command/response and data input/output), and control signals CS, HOLD#, WP#. This hardware interface creates a low pin-count device with a standard pinout that remains the same from one density to another, supporting future upgrades to higher densities without board redesign.

Each block of the serial NAND Flash device is divided into 64 programmable pages, each page consisting of 2112 bytes. Each page is further divided into a 2048-byte data storage region and a 64-byte spare area. The 64-byte area is typically used for memory and error management functions.

With internal ECC enabled as the default after power on, ECC code is generated internally when a page is written to the memory core. The ECC code is stored in the spare area of each page. When a page is read to the cache register, the ECC code is calculated again and compared with the stored value. Errors are corrected if necessary. The device either outputs corrected data or returns an ECC error status.

The first block is valid when shipped from factory. Security functions are also provided including software block protection: Lock tight and hardware protection modes avoid array data corruption.

PIN CONFIGURATION (TOP VIEW)

8-Contact WSON

(WSON 8C, 8mmx6 mm Body, 1.27mm Contact Pitch)

Pin Description

Pin Name	Functions
CS#	Chip Select (Input) The device is activated ⁽¹⁾ /deactivated ⁽²⁾ as CS# is driven LOW/HIGH. After power-on, the device requires a falling-edge on CS# before any command can be written. The device goes to standby mode when no PROGRAM, ERASE, or WRITE STATUS REGISTER operation is in progress.
HOLD# / IO ₃	Hold (Input) / IO₃ (Input/Output) Hold pauses any serial communication with the device without deselecting it ⁽³⁾ . When driven LOW, SO is at high impedance (Hi-Z), and all inputs in SI and SCK are ignored; CS# also should be driven LOW. HOLD# must not be driven during x4 operation; it means HOLD function is only available for standard and x2 SPI.
WP# / IO ₂	Write Protect (Input) / IO₂ (Input/Output) WP# is driven LOW to prevent writing the Feature Registers. The WP-E bit in Protection Register controls the function of WP#, and the other bits in Register can protect a specific portion by hardware. When WP-E=1, the device is in the Hardware-protection mode that WP# functions as a dedicated active low input pin for the Write Protect of the device. If WP-E=1 and WP# goes LOW, the device will become READ-only. When WP-E=0, the device is in the Software-protection mode that only Protection Register can be protected. WP# functions as a data I/O pin. WP# must not be driven during x4 operation; it means Write Protect function is only available for standard and x2 SPI.
SCK	Serial Clock (Input) SCK provides serial interface timing. Address, commands, and data in SI are latched on the rising edge of SCK. Output (data in SO) is triggered after the falling-edge of SCK. The clock is valid only when the device is active. ⁽⁴⁾
SI / IO ₀	Serial Data Input (Input) / IO₀ (Input/Output) SI transfers data serially into the device. Device latches addresses, commands, and program data in SI on the rising-edge of SCK. SI must not be driven during x2 or x4 READ operation.
SO / IO ₁	Serial Data Output (Output) / IO₁ (Input/Output) SO transfers data serially out of the device on the falling-edge of SCK. SO must not be driven during x2 or x4 PROGRAM operation.
V _{CC} ⁽⁵⁾	Power V _{CC} is the power supply for device.
V _{SS} ⁽⁵⁾	Ground
NC	No Connection Not internally connected.

Note:

1. CS# places the device in active power mode.
2. CS# deselects the device and places SO at high impedance.
3. It means HOLD# input doesn't terminate any READ, PROGRAM, or ERASE operation currently in progress.
4. SI and SO can be triggered only when the clock is valid.
5. Connect all V_{CC} and V_{SS} pins of each device to common power supply outputs. Do not leave V_{CC} or V_{SS} disconnected.

BLOCK DIAGRAM

ARRAY ORGANIZATION

Array Address

Data Bits	0	1	2	3	4	5	6	7	Address
1 st byte	A ₀	A ₁	A ₂	A ₃	A ₄	A ₅	A ₆	A ₇	Column Address
2 nd byte	A ₈	A ₉	A ₁₀	A ₁₁	X	X	X	X	Column Address
3 rd byte	A ₁₂	A ₁₃	A ₁₄	A ₁₅	A ₁₆	A ₁₇	A ₁₈	A ₁₉	Row Address
4 th byte	A ₂₀	A ₂₁	A ₂₂	A ₂₃	A ₂₄	A ₂₅	A ₂₆	A ₂₇	Row Address
5 th byte	X	X	X	X	X	X	X	X	Dummy Address

Note:

1. Column Address: Starting Address of the Register.
2. X = don't care.
3. The device ignores any additional input of address cycles than required.

COMMAND SET

Function	Op Code	Address Byte	Dummy Byte	Data Bytes
BLOCK ERASE	D8h	3	0	0
GET FEATURE ⁽¹⁾	0Fh	1	0	1
SET FEATURE	1Fh	1	0	1
WRITE DISABLE	04h	0	0	0
WRITE ENABLE	06h	0	0	0
PROGRAM LOAD	02h	2	0	1 to 2112
PROGRAM LOAD x4 ⁽²⁾	32h	2	0	1 to 2112
PROGRAM LOAD RANDOM DATA	84h	2	0	1 to 2112
PROGRAM LOAD RANDOM DATA x4 ⁽²⁾	34h	2	0	1 to 2112
PROGRAM EXECUTE	10h	3	0	0
PAGE READ	13h	3	0	0
READ FROM CACHE	03h, 0Bh	2	1	1 to 2112
READ FROM CACHE with 4Byte Address	0Ch	2	3	1 to 2112
READ FROM CACHE x2	3Bh	2	1	1 to 2112
READ FROM CACHE x2 with 4Byte Address	3Ch	2	3	1 to 2112
READ FROM CACHE x4 ⁽²⁾	6Bh	2	1	1 to 2112
READ FROM CACHE x4 with 4Byte Address ⁽²⁾	6Ch	2	3	1 to 2112
FAST READ X2 IO	BBh	2	1	1 to 2112
FAST READ X2 IO with 4Byte Address	BCh	2	3	1 to 2112
FAST READ X4 IO	EBh	2	2	1 to 2112
FAST READ X4 IO with 4Byte Address	ECh	2	5	1 to 2112
READ ID ⁽³⁾	9Fh	0	1	2
RESET	FFh	0	0	0

Note:

1. Refer to Feature Register.
2. Command/Address is 1-bit input per clock period, data is 4-bit input/output per clock period.
3. Address is 00h to get JEDEC ID

Absolute Maximum Ratings

Parameter	Symbol	Rating	Unit
Voltage on any pin relative to V _{SS}	V _{CC}	-0.6 to +4.6	V
	V _{IN}	-0.6 to +4.6	
	V _{I/O}	-0.6 to V _{CC} + 0.3 (< 4.6)	
Temperature Under Bias	T _{BIAS}	-40 to +125	°C
Storage Temperature	T _{STG}	-65 to +150	°C
Short Circuit Current	I _{OS}	5	mA

Note:
Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Recommended Operating Conditions

(Voltage reference to GND, T_A = -40 to 105°C)

Parameter	Symbol	Min.	Typ.	Max.	Unit
Supply Voltage	V _{CC}	2.7	3.3	3.6	V
Supply Voltage	V _{SS}	0	0	0	V

DC and Operation Conditions

(Recommended operating conditions otherwise noted)

Parameter		Symbol	Test Conditions	Min.	Typ. ²	Max.	Unit
Operating Current	Page Read with Serial Access	I _{CC1}	CS#=V _{IL} , I _{OUT} =0mA	-	16	20	mA
	Program	I _{CC2}	-	-	16		
	Erase	I _{CC3}	-	-	16		
Stand-by Current (TTL)		I _{SB1}	CS#=V _{IH} , WP#=0V/V _{CC}	-	-	1	mA
Stand-by Current (CMOS)		I _{SB2}	CS#= V _{CC} -0.2, WP#=0V/ V _{CC}	-	10	50	uA
Input Leakage Current		I _{LI}	V _{IN} =0 to V _{CC} (max)	-	-	±10	uA
Output Leakage Current		I _{LO}	V _{OUT} =0 to V _{CC} (max)	-	-	±10	uA
Input High Voltage		V _{IH} ¹	-	0.7 x V _{CC}	-	V _{CC} +0.3	V
Input Low Voltage, All inputs		V _{IL} ¹	-	-0.3	-	0.2 x V _{CC}	V
Output High Voltage Level		V _{OH}	I _{OH} =-20uA	0.7 x V _{CC}	-	-	V
Output Low Voltage Level		V _{OL}	I _{OL} =1mA	-	-	0.15 x V _{CC}	V

- Note:**
- V_{IL} can undershoot to -0.4V and V_{IH} can overshoot to V_{CC}+0.4V for durations of 20ns or less.
 - Typical value are measured at V_{CC} =3.3V, T_A=25°C. Not 100% tested.

Valid Block and Error Management

Description	Requirement
Minimum / Maximum number of valid block number of block	1004 / 1024
Bad block mark	Non FFh
Mark location	Column 2048 of page 0 and page 1

Note:

1. The device may include initial invalid blocks when first shipped. Additional invalid blocks may develop while being used. The number of valid blocks is presented with both cases of invalid blocks considered. Invalid blocks are defined as blocks that contain one or more bad bits which cause status failure during program and erase operation. Do not erase or program factory-marked bad blocks. Refer to the attached technical notes for appropriate management of initial invalid blocks.
2. The 1st block, which is placed on 00h block address, is guaranteed to be a valid block at the time of shipment and is guaranteed to be a valid block up to 1K program/erase cycles with 1bit/512Byte ECC.

AC Test Condition(T_A=-40 to 105°C, V_{CC}=2.7V~3.6V)

Parameter	Condition
Input Pulse Levels	0.2V _{CC} to 0.8V _{CC}
Input Rise and Fall Times	Max: 2.4ns
Input and Output Timing Levels	V _{CC} /2
Output Load	1 TTL Gate and C _L =30pF

Capacitance(T_A=25°C, V_{CC}=3.3V, f=1.0MHz)

Item	Symbol	Test Condition	Min.	Max.	Unit
Input / Output Capacitance	C _{I/O}	V _{IL} = 0V	-	8	pF
Input Capacitance	C _{IN}	V _{IN} = 0V	-	8	pF

Note: Capacitance is periodically sampled and not 100% tested.**Read / Program / Erase Timing Characteristics**

Parameter	Symbol	Min.	Typ.	Max.	Unit
Average Program Time with ECC ON	t _{PROG}	-	400	900	us
Number of Partial Program Cycles in the Same Page	NOP	-	-	4	Cycle
Block Erase Time	t _{BERS}	-	4	10	ms
Read Page Time with ECC ON	t _{RD}	-	-	100	us
Power-on reset time from V _{CC} Min	t _{POR}	-	-	1	Ms
Write inhibit voltage	V _{WI}	-	-	2.5	V

General Timing Characteristic

Parameter	Symbol	Min.	Max.
Clock frequency	f _c		104MHz
Hold# non-active hold time relative to SCK	t _{CD}	4.5ns	
Hold# hold time relative to SCK	t _{CH}	4.5ns	
Command deselect time	t _{CS}	80ns	
CS# Setup Time	t _{CSS}	5ns	
CS# Hold Time	t _{CSH}	5ns	
The last valid Clock low to CS# high	t _{CSCL}	5ns	
Output disable time	t _{DIS}		20ns
Hold# non-active setup time relative to SCK	t _{HC}	4.5ns	
Hold# setup time relative to SCK	t _{HD}	4.5ns	
Data input setup time	t _{SUDAT}	2ns	
Data input hold time	t _{HDDAT}	3ns	
Output hold time	t _{HO}	1.5ns	
Hold# to output Hi-Z	t _{HZ}		7ns
Hold# to output Low-Z	t _{LZ}		7ns
Clock low to output valid	t _V		8ns
Clock high time	t _{WH}	4ns	
Clock low time	t _{WL}	4ns	
Clock rise time (slew rate)	t _{CRT}	0.1V/ns	
Clock fall time (slew rate)	t _{CFT}	0.1V/ns	
WP# setup time	t _{WPS}	20ns	
WP# hold time	t _{WPH}	100ns	
Resetting time during Idle/Read/Program/Erase	t _{RST}		5/5/10/500us

Note:

1. For first RESET condition after power up, t_{RST} will be 1ms MAX.

Technical Notes

Bus Operation

SPI NAND supports two SPI modes:

(Mode 0) CPOL (clock polarity) = 0, CPHA (clock phase) = 0

(Mode 3) CPOL=1, CPHA=1

Input data is latched in on the rising edge of SCK, and output data is available from the falling edge of SCK for both modes. When CS# is high, keep SCK at V_{CC} (Mode 0) or V_{SS} (Mode 3). Do not begin toggling SCK until after CS# is driven LOW.

SPI Modes Timing

Note:

1. All timing diagrams shown in this data sheet are mode 0.

Feature Operations

The GET FEATURE (0Fh) and SET FEATURE (1Fh) commands are used to alter the device behavior from the default power-on behavior. These commands use a 1-Byte feature address to determine which feature is to be read or modified.

When a feature is set, it remains active until the device is power cycled or the feature is written to. Unless otherwise specified in Feature Setting Table, once the device is set, it remains set, even if a RESET (FFh) command is issued.

Feature Settings Table

Register	Acronym	Address	Data Bits							
			7	6	5	4	3	2	1	0

Shipment default	0	1	1	1	1	1	0	0

Note:

1. All bits in A0h are volatile writable.
2. Once BP[3:0], T/B-P, and WPE bits are set correctly.

Related Protection Bits of Protection Register Table

Software Protection (Controller, X4 Program/ Read is enable)				
PRP0 (7)	WPE (1)	PRP1 (0)	WP# IO2	Description
0	0	0	X	No WP# functionality, and WP# pin will always function as IO2
1	0	0	0	PR ⁽¹⁾ cannot be changed, and WP# pin will function as IO2 for X4 operation
1	0	0	1	PR can be changed, and WP# pin will function as IO2 for X4 operation
X	0	1	X	Power Lock Down ⁽²⁾ PR, and WP# pin will always function as IO2
Hardware Protection (System Circuit/ PCB layout, X4 Program/ Read is disable)				
PRP0 (7)	WPE (1)	PRP1 (0)	WP# IO2	Description
X	1	0	VCC	PR can be changed
X	1	1	VCC	Power Lock Down PR
X	1	X	GND	All Write operations are blocked, and entire device (Register, Array, and OTP area) is Read-only

Note:

1. PR means Protection Register [7:0].
2. When PRP1 = "1", PR cannot be changed during the current power cycle. Only after power cycle can reset the state to PRP1 = "0" and PRP0 = "0"

Block Protect Bits of Protection Register Table

BP3 (6)	BP2 (5)	BP1 (4)	BP0 (3)	T/BP (2)	Protected Rows
0	0	0	0	X	None; all unlocked
0	0	0	1	0	Upper 1/512 locked (BLK1022 & 1023)
0	0	1	0	0	Upper 1/256 locked
0	0	1	1	0	Upper 1/128 locked
0	1	0	0	0	Upper 1/64 locked
0	1	0	1	0	Upper 1/32 locked
0	1	1	0	0	Upper 1/16 locked
0	1	1	1	0	Upper 1/8 locked
1	0	0	0	0	Upper 1/4 locked
1	0	0	1	0	Upper 1/2 locked
0	0	0	1	1	Lower 1/512 locked (BLK0 & 1)
0	0	1	0	1	Lower 1/256 locked
0	0	1	1	1	Lower 1/128 locked
0	1	0	0	1	Lower 1/64 locked
0	1	0	1	1	Lower 1/32 locked
0	1	1	0	1	Lower 1/16 locked
0	1	1	1	1	Lower 1/8 locked
1	0	0	0	1	Lower 1/4 locked
1	0	0	1	1	Lower 1/2 locked
1	0	1	X	X	All locked
1	1	X	X	X	All locked

Note:

1. X = don't care
2. Any Erase or Program command for the protected area will be ignored.

Configuration Register**Configuration Register Setting Table**

B0h	Data Bits							
Bit	7	6	5	4	3	2	1	0
Definition	CFG2	CFG1	Reserved	ECC Enable ⁽²⁾	Reserved	Reserved	CFG0	HD
Shipment default	0	0	0	1	0	0	0	0

Note:

1. Internal ECC for all READ and PROGRAM operations can be enabled (ECC enable = 1)
2. Bit7, Bit6, Bit4 and Bit1 are volatile writable.

OTP State Bits of Configuration Register Table

CFG2	CFG1	CFG0	State
0	0	0	Normal operation (read array)
0	1	0	Access OTP area/Parameter/Unique ID
1	X	0	Not applicable
X	X	1	Not applicable

Hold Disable Bit (HD)

When WP-E is "0", during the x4 operation, to prevent accidental operation from host to place the Hold Input (drive Hold# low), Hold Disable (HD) can be set by SET Feature (B0h, 0Bit).

While HD bit is "0" (default), during the x4 operation, HOLD# function still can be enabled before the x4 operation command. When the x4 operation command is issued, HOLD# pin will become a data I/O pin for the x4 operations and no HOLD# function is available until the current x4 operation finishes.

HD bit is allowed to be set "1" only when WP-E bit is "0". While WP-E bit is "0" and HD bit is set "1", Hold# function as well as WP# control function is disabled. HD bit returns to "0" after next power cycle.

Status Register

Software can read status register during the NAND device operation by issuing GET FEATURE (0Fh) command, followed by the feature address C0h. The status register will output the status of the operation, refer to Status Register Setting Table, Bits of Status Register Table and ECC Status Bits of Status Register Table.

Status Register Setting Table

C0h	Data Bits							
Bit	7	6	5	4	3	2	1	0
Definition	Reserved	Reserved	ECC_Status1	ECC_Status0	Program_Fail	Erase_Fail	Write Enable Latch	Operation In Progress
Shipment default	0	0	0	0	0	0	0	0

Status Register Bit Descriptions

Bit Name	Mode	Description
ECC_status1 (Bit 5) ECC_status0 (Bit 4)	R	ECC Status Bits of Status Register Table shows the ECCS definitions. ECC_S is set to 00h either following a RESET, or at the beginning of the READ. It is then updated after the device completes a valid READ operation. ECC_S is invalid if ECC is disabled (via a SET FEATURE command to get access the configuration register). After power-up RESET, ECC_S is set to reflect the contents of block 0, page 0.
Program fail (Bit 3)	R	P_Fail is set to 1 as a program failure has occurred. P_Fail = 1 will also be set if the user attempts to program an invalid address or a locked region. P_Fail is set to 0 during the PROGRAM EXECUTE command sequence or the RESET command.
Erase fail (Bit 2)	R	E_Fail is set to 1 as an erase failure has occurred. E_Fail = 1 will also be set if the user attempts to erase a locked region, or if ERASE operation fails. E_Fail is set to 0 at the start of the BLOCK ERASE command sequence or the RESET command.
Write enable latch (Bit 1)	W	WEL must be set to 1 to indicate the current status of the write enable latch, prior to issuing PROGRAM EXECUTE or BLOCK ERASE command. It is set by issuing WRITE ENABLE command. WEL can also be cleared (WEL=0) by issuing the WRITE DISABLE command or RESET command or after a successful PROGRAM/ERASE operation.
Operation in progress (Bit 0)	R	OIP is set to 1 when the device is busy; it means a PROGRAM EXECUTE, PAGE READ, BLOCK ERASE or RESET command is executing. OIP is cleared to 0 as the interface is in ready state.

ECC Status Register Bit Descriptions

ECCS1 (5)	ECCS0 (4)	Description
0	0	No errors
0	1	1 bit errors detected and corrected
1	0	2 bit errors detected and not corrected
1	1	Reserved

ECC Protection

ECC is enabled after device power-up, so the default PROGRAM and READ commands operate with internal ECC in the active state. During a PROGRAM operation, the device calculates an ECC code on the 2KB page in the cache register, before the page is written to the NAND Flash array. The ECC code is stored in the spare area of the page in array.

During a READ operation, the page data is read from the array to the cache register, where the ECC code is calculated and compared with the ECC code value read from the array. If a single-bit data error is discovered, the error is corrected in the cache register and only the corrected data is on the output bus.

ECC Protection Table

Max Byte Address	Min Byte Address	ECC Protected	Area	Description
1FFh (511)	000h (0)	Yes	Main 0	User data 0 ¹
3FFh (1023)	200h (512)	Yes	Main 1	User data 1 ¹
5FFh (1535)	400h (1024)	Yes	Main 2	User data 2 ¹
7FFh (2047)	600h (1536)	Yes	Main 3	User data 3 ¹
801h (2049)	800h (2048)	No		Reserved (Bad Block Marker)
803h (2051)	802h (2050)	No	Spare 0	User Data II
807h (2055)	804h (2052)	Yes	Spare 0	User Data I
80Dh (2061)	808h (2056)	Yes		ECC for Main 0
80Fh (2063)	80Eh (2062)	No		ECC for Spare 0
811h	810h	No		Reserved
813h	812h	No	Spare 1	User Data II
817h	814h	Yes	Spare 1	User Data I
81Dh	818h	Yes		ECC for Main 1
81Fh	81Eh	No		ECC for Spare 1
821h	820h	No		Reserved
823h	822h	No	Spare 2	User Data II
827h	824h	Yes	Spare 2	User Data I
82Dh	828h	Yes		ECC for Main 2
82Fh	82Eh	No		ECC for Spare 2
831h	830h	No		Reserved
833h	832h	No	Spare 3	User Data II
837h	834h	Yes	Spare 3	User Data I
83Dh	838h	Yes		ECC for Main 3
83Fh	83Eh	No		ECC for Spare 3

Note:

1. The user areas must be programmed within a single partial-page programming operation so the NAND Flash device can calculate the proper ECC bytes.
2. When internal ECC is enabled, these areas are prohibited to be programming.

0	1	75 %
1	0	50 %
1	1	25%

Array Write Enable / Disable

The WRITE ENABLE (06h) command sets the WEL bit (in status register) to 1. This is required in the following WRITE operations that change the contents of the memory array: PAGE PROGRAM, BLOCK ERASE, and OTP PROGRAM.

Contrarily, the WRITE DISABLE (04h) command sets the WEL bit to 0. This disables PAGE PROGRAM, BLOCK ERASE, and OTP PROGRAM.

WRITE ENABLE (06h) Timing**WRITE DISABLE (04h) Timing**

Error Management

Mask Out Initial Invalid Blocks

Initial invalid blocks are defined as blocks that contain one or more initial invalid bits whose reliability is not guaranteed by ESMT. The information regarding the initial invalid blocks is called the initial invalid block information. Devices with initial invalid blocks have the same quality level as devices with all valid blocks and have the same AC and DC characteristics. An initial invalid block does not affect the performance of valid blocks because it is isolated from the bit line and the common source line by a select transistor. The system design must be able to mask out the initial invalid blocks via address mapping.

The 1st block, which is placed on 00h block address, is guaranteed to be a valid block up to 1K program/erase cycles with 1bit/512Byte ECC.

Identifying Initial invalid Blocks

All device locations are erased (FFh) except locations where the initial invalid block(s) information is written prior to shipping. The initial invalid block(s) status is defined by the 1st byte in the spare area. ESMT makes sure that either the 1st or 2nd page of every initial invalid block has non-FFh data at the 1st byte column address in the spare area.

Do not erase or program factory-marked bad blocks. The host controller must be able to recognize the initial invalid block information and to create a corresponding table to manage block replacement upon erase or program error when additional invalid blocks develop with Flash memory usage.

Algorithm for Bad Block Scanning

```
For (i=0; i<Num_of_LUs; i++)
{
    For (j=0; j<Blocks_Per_LU; j++)
    {
        Defect_Block_Found=False;

        Read_Page(lu=i, block=j, page=0);
        If (Data[column=First_Byte_of_Spare_Area]!=FFh) Defect_Block_Found=True;

        Read_Page(lu=i, block=j, page=1);
        If (Data[column=First_Byte_of_Spare_Area]!=FFh) Defect_Block_Found=True;

        If (Defect_Block_Found) Mark_Block_as_Defective(lu=i, block=j);
    }
}
```

Block Replacement

Within its lifetime, number of invalid blocks may increase with NAND Flash memory. Refer to the qualification report for the actual data. The following possible failure modes should be considered to implement a highly reliable system. In the case of failure after ERASE or PROGRAM in status register, block replacement should be done. Because PROGRAM status fail during a page program does not affect the data of the other pages in the same block, block replacement can be executed with a page-sized buffer by finding an erased empty block and reprogramming the current target data and copying the rest of the replaced block.

In case of READ, ECC must be employed. To improve the efficiency of memory space, it is recommended that the read or verification failure due to single bit error be reclaimed by ECC without any block replacement. The additional block failure rate does not include those reclaimed blocks.

Addressing for Program Operation

Within a block, the pages must be programmed consecutively from the LSB (least significant bit) page of the block to MSB (most significant bit) pages of the block. Random page address programming is prohibited. In this case, the definition of LSB page is the LSB among the pages to be programmed. Therefore, LSB page doesn't need to be page 0.

Operations and Timing Diagrams

Read Operations and Serial Output

The command sequence is follows:

- 13h (PAGE READ to cache)
- 0Fh (GET FEATURE command to read the status)
- 0Bh or 03h (READ FROM CACHE x1); 0Ch (x1) / 3Bh (x2); 3Ch (x2) / 6Bh (x4); 6Ch (x4)
- BBh (x2); BCh (x2) / EBh (x4); ECh (x4)

PAGE READ command requires 24-bit address with 8 dummy and a 16-bit row address. After row address is registered, the device starts the transfer from the main array to the cache register, and is busy for t_R time. During this time, GET FEATURE command can be issued to monitor the status of the operation⁽¹⁾. Following a status of successful completion, READ FROM CACHE command must be issued to read the data out of the cache.

READ FROM CACHE command requires 16-bit address with 4 dummy bits and a 12-bit column address for the starting byte. The starting byte can be 0 to 2011, but after the end of the cache register is reached, the data does not wrap around and SO goes to a Hi-Z state.

BBh and BCh command allow for improved random access while maintaining two IO pins: SI and SO. It is similar to 3Bh command but with the capability to input Column Address or dummy clocks two bits per clock.

The data output sequence will start from the location specified by the Column Address input and continue to the end of the Page. Once the last byte of data is output, both SI (SO0) and SO (SO1) will become Hi-Z.

Note1 : If the status is not ready (OIP=1), the IO pins will keep on a Hi-Z state after READ FROM CACHE command.

PAGE READ (13h) Timing

Serial Output Timing

READ FROM CACHE (03h or 0Bh) Timing

READ FROM CACHE with 4-Byte Address (0Ch) Timing

READ FROM CACHE x2 (3Bh) Timing

READ FROM CACHE x2 with 4-Byte Address (3Ch) Timing

READ FROM CACHE x4 (6Bh) Timing

READ FROM CACHE x4 with 4-Byte Address (6Ch) Timing

Fast Read X2 IO (BBh) Timing

Fast Read X2 IO with 4Byte Address (BCh) Timing

Fast Read X4IO (EBh) Timing

Fast Read X4IO with 4Byte Address (ECh) Timing

Program Operations and Serial Input

Page Program

The command sequence is follows:

- 06h (WRITE ENABLE)
- 02h (PROGRAM LOAD x1) / 32h (x4)
- 10h (PROGRAM EXECUTE)
- 0Fh (GET FEATURE command to read the status)

The page program operation sequence programs 1 byte to 2112 bytes of data within a page. If WRITE ENABLE command is not issued (WEL bit is not set), then the rest of the program sequence is ignored. PROGRAM LOAD command requires 16-bit address with 4 dummy and a 12-bit column address, then the data bytes to be loaded into cache register. Only four partial page programs are allowed on a single page. If more than 2112 bytes are loaded, then those additional bytes are ignored by the cache register.

After the data is loaded, PROGRAM EXECUTE command must be issued to transfer the data from cache register to main array, and is busy for t_{PROG} time. PROGRAM EXECUTE command requires 24-bit address with 8 dummy bits and a 16-bit row address.

PROGRAM LOAD (02h) Timing

PROGRAM LOAD x4 (32h) Timing

PROGRAM EXECUTE (10h) Timing

Don't Care

Random Data Program

The command sequence is follows:

- 06h (WRITE ENABLE)
- 84h (PROGRAM LOAD RANDOM DATA x1) / 34h (x4)
- 10h (PROGRAM EXECUTE)
- 0Fh (GET FEATURE command to read the status)

The random data program operation sequence programs or replaces data in a page with existing data. PROGRAM LOAD RANDOM DATA command requires 16-bit address with 4 dummy bits and a 12-bit column address. New data is loaded in the column address provided. If the random data is not sequential, then another PROGRAM LOAD RANDOM DATA command must be issued with a new column address. After the data is loaded, PROGRAM EXECUTE command can be issued to start the programming operation.

PROGRAM LOAD RANDOM DATA (84h) Timing

PROGRAM LOAD RANDOM DATA x4 (34h) Timing

Serial Input Timing**Internal Data Move**

The command sequence is follows:

- 13h (PAGE READ to cache)
- 06h (WRITE ENABLE)
- 84h (PROGRAM LOAD RANDOM DATA x1) / 34h (x4); this is OPTIONAL in sequence.
- 10h (PROGRAM EXECUTE)
- 0Fh (GET FEATURE command to read the status)

The INTERNAL DATA MOVE operation sequence programs or replaces data in a page with existing data. Prior to performing an INTERNAL DATA MOVE operation, the target page content must be read into the cache register. PAGE READ command must be followed with a WRITE ENABLE command to change the contents of memory array.

Erase Operation

The command sequence is follows:

- 06h (WRITE ENABLE)
- D8h (BLOCK ERASE)
- 0Fh (GET FEATURE command to read the status)

BLOCK ERASE command requires 24-bit address with 8 dummy bits and a 16-bit row address. If WRITE ENABLE command is not issued (WEL bit is not set), then the rest of the erase sequence is ignored. After the row address is registered, the control logic automatically controls the timing and the erase-verify operations, and the device is busy for t_{BERS} time. BLOCK ERASE command operates on one block at a time.

BLOCK ERASE (D8h) Timing

Read ID

READ ID reads the 2-byte identifier code programmed into the device, which includes ID and device configuration data as shown in the table below.

READ ID Timing

ID Definition Table

Product ID	1 st Cycle (Maker Code)	2 nd Cycle (Device Code)	3 rd Cycle	4 th Cycle
F50L1G41LC (2P)	8Ch	2Ch	(repeat 1 st Cycle)	(repeat 2 nd Cycle)

	Description
1 st Byte	Maker Code
2 nd Byte	Device Code

Item	Description	I/O7	I/O6	I/O5	I/O4	I/O3	I/O2	I/O1	I/O0
Density	1Gb	0	0	1					
	2Gb	0	1	0					
	4Gb	0	1	1					
	8Gb	1	0	0					
Voltage	1.8V								1
	3.3V								0
Interface	SPI				0	1			
	X8				0	0			
	X16				1	0			
Default ECC	Disable						0		
	Enable						1		
Reserved	Reserved							0	

WP# Timing

HOLD# Timing

HOLD# input provides a method to pause serial communication with the device but doesn't terminate any READ, PROGRAM, or ERASE operation currently in progress.

Hold mode starts at the falling edge of HOLD# provided SCK is also Low. If SCK is High when HOLD# goes Low, hold mode begins after the next falling edge of SCK. Similarly, hold mode is exited at the rising edge of HOLD# provided SCK is also Low. If SCK is High, hold mode ends after the next falling edge of SCK.

During hold mode, SO is Hi-Z, and SI and SCK inputs are ignored.

RESET Operation

The RESET command (FFh) is used to put the memory device into a known condition and to abort the command sequence in progress. READ, PROGRAM, and ERASE commands can be aborted while the device is in the busy state. Once the RESET command is issued to the device, it will take tRST to reset. During this period, the GET FEATURE command could be issued to monitor the status (OIP).

All other status register bits will be cleared. The ECC status register bits will be cleared after a reset. The configuration register bits and the block lock register bits will not be cleared after reset until the device is power cycled or is written to by SET FEATURE command.

RESET (FFh) Timing

Power-Up and Power-Down

At power-up and power-down, the device must not be selected; that is, CS# must follow the voltage applied on VCC until VCC reaches the correct values: VCC, min at power-up and VSS at power-down. NAND Flash devices are designed to prevent data corruption during power transitions. VCC is internally monitored and when VCC reaches the write inhibit voltage VWI, a minimum of 250µs must elapse before issuing a RESET (FFh) command. After issuing the RESET command, 1ms must elapse before issuing any other command. GET FEATURE command could be issued to poll the status register (OIP) before the first access. Normal precautions must be taken for supply line decoupling to stabilize the VCC supply. Each device in a system should have the VCC line decoupled by a suitable capacitor (typically 100nF) close to the package pins.

At power-down, the device is designed to offer protection from any involuntary operation during power-transitions. An internal voltage detector disables all functions whenever VCC is below VWI.

Note: For power cycle testing, the system must not initiate the power-up sequence until VCC drops down to 0V.

SPI Power-Up

SPI Power-Up Timing

Developed an alternative SPI NAND sequence that does not require issuing an explicit RESET(FFh) command upon power-up. This is default device initialization setting. When device V_{CC} has reached the write inhibit voltage, the device automatically kicks off the initialization. At default setting, first page data would be automatically loaded into cache register. During the initialization, GET FEATURE command could be issued to poll the status register (OIP) before the first access; Or, the first access can occur 1.25ms after V_{CC} reaches $V_{CC,min}$.

Note:

1. Poll status register OIP bit is allowed during device initialization. During initialization, page autoloading is independent of the state of CS#.

Read Unique ID Page / Read Parameter Page / Read CASN Page / OTP Operations

In addition to the main memory array, the device is also equipped with one Unique ID Page, and twenty-eight One-Time-Programmable Pages. The Unique ID Page contains 16 identical copies of the 32-Byte data. The Parameter Page contains 3 identical copies of the 256-Byte data. The CASN Page contains 3 identical copies of the 256-Byte data. Both pages are Read only.

This flash device also offers one-time programmable memory area. 28 full pages of OTP data are available on the device, and the entire range is guaranteed to be good. The OTP area is accessible only through the OTP commands. Regarding OTP Read, Read Unique ID Page, Read Parameter Page and Read CASN Page, please refers to the specific Page addresses defined in OTP Area Details Table.

The OTP area leaves the factory in an unwritten state. The OTP area cannot be erased.

The OTP area is only accessible while CFG[2:0]=010b. To set the device to OTP operation mode, issue the Set Feature (1Fh) command. When the device is in OTP operation mode, subsequent Read and/or Page Program (both X1 and X4) are applied to the OTP area. Please refer to relative command sequences defined in datasheet. When you want to come back to normal operation, you need to set CFG[2:0]=000b. Otherwise, device will stay in OTP mode.

OTP/ Read / Read Unique ID / Read Parameter Page / Read CASN Page:

- Issue the Set Feature (1Fh) command.
- Issue the feature address (B0h).
- Set CFG[2:0] =010b.
- Issue the Page Read (13h) command with a specific Page address.

OTP Program:

- Issue the Set Feature (1Fh) command.
- Issue the feature address (A0h).
- Set Protection bit to 0.
- Issue the feature address (B0h).
- Set CFG[2:0] =010b.
- Issue the Write Enable (06h) command.
- Issue the Program Load (02h) and Program Execute (10h) commands.

OTP Area Details Table

Item	Value	Description	Data Length
Unique ID Page address	00h	Factory programmed, Read only	32-Byte x 16
Parameter Page address / CASN Page address	01h	Factory programmed, Read only	256-Byte x 6
Number of OTP pages	28	One Time Program	2112-Byte
OTP page address	02h – 1Dh	One Time Program	2112-Byte
Number of partial page programs for each page in the OTP area	1	One Time Program	2112-Byte

Parameter Page Data Table

Byte	Description	Value
0-3	Parameter page signature ("O", "N", "F", "I")	4Fh, 4Eh, 46h, 49h

Controlling dimension : Millimeter.
(Revision date : Sep 09. 2025)

Revision History

Revision	Date	Description
1.0	2025.05.21	Original
1.1	2025.07.10	Modify: Read ID Timing diagram
1.2	2025.09.27	Modify 8-contact WSON PKG dimension
1.3	2026.09.02	OTP lock info removed

Any semiconductor devices may have inherently a certain rate of failure. To minimize risks associated with customer's application, adequate design and operating safeguards against injury, damage, or loss from such failure, should be provided by the customer when making application designs.

ESMT's products are not authorized for use in critical applications such as, but not limited to, life support devices or system, where failure or abnormal operation may directly affect human lives or cause physical injury or property damage. If products described here are to be used for such kinds of application, purchaser must do its own quality assurance testing appropriate to such applications.
